

LehighHacks 2016

BlockOne IoT Challenge

Overview/Challenge:

Blockchain, or distributed ledger, is providing a new way to orchestrate workflows and collaboration among multiple parties in a network, and to process and record information in cryptographically secure methods.

At same time, the world is becoming more instrumented and software-enabled giving rise to the internet of things (IoT), where billions of data points are being captured from physical “things.”

Thomson Reuters invites students to innovate and marry BlockOne and IoT data to create an impactful and technically elegant prototype around identity of “things.”

Good Luck!
